### **Product Specification**

### 1. General Description

The LC470WUH is a Color Active Matrix Liquid Crystal Display with an integral External Electrode Fluorescent Lamp(EEFL) backlight system. The matrix employs a-Si Thin Film Transistor as the active element. It is a transmissive type display operating in the normally black mode. It has a 46.96 inch diagonally measured active display area with WUXGA resolution (1080 vertical by 1920 horizontal pixel array). Each pixel is divided into Red, Green and Blue sub-pixels or dots which are arranged in vertical stripes. Gray scale or the luminance of the sub-pixel color is determined with a 8-bit gray scale signal for each dot. Therefore, it can present a palette of more than 16.7M(true) colors.

It is intended to support LCD TV, PCTV where high brightness, super wide viewing angle, high color gamut, high color depth and fast response time are important.

#### **General Features**

<u></u>	
Active Screen Size	46.96 inches(1192.87mm) diagonal
Outline Dimension	1096.0(H) x 640.0 (V) x 35.5 mm(D) (Typ.)
Pixel Pitch	0.5415 mm x 0.5415 mm
Pixel Format	1920 horiz. by 1080 vert. Pixels, RGB stripe arrangement
Color Depth	8-bit, 16.7 M colors (※ 1.06B colors @ 10 bit (D) System Output )
Drive IC Data Interface	Source D-IC : 8-bit mini-LVDS, gamma reference voltage, and control signals Gate D-IC : Gate In Panel
Luminance, White	500 cd/m² (Center 1point ,Typ.)
Viewing Angle (CR>10)	Viewing angle free ( R/L 178 (Min.), U/D 178 (Min.))
Power Consumption	Total 203.1 W (Typ.) (Logic=8.1 W with T-CON, Backlight=195W @ without Inverter )
Weight	12.0Kg (Typ)
Display Mode	Transmissive mode, Normally black
Surface Treatment	Hard coating(3H), Anti-glare treatment of the front polarizer (Haze 10%)

Ver1.1 4 /43

# **Product Specification**

# 2. Absolute Maximum Ratings

The following items are maximum values which, if exceeded, may cause faulty operation or damage to the LCD module.

Table 1. ABSOLUTE MAXIMUM RATINGS

Parameter		Symbol	Value		Unit	Note
		Symbol	Min	Max	Oill	Note
Power Input Voltage	LCD Circuit	VLCD	-0.3	+14.0	VDC	
Backlight Input Voltage	Operating Voltage ( One Side )	VBL	600	1300	VRMS	1
T-Con Option Selection Voltage		VLOGIC	-0.3	+4.0	VDC	
Operating Temperature	Operating Temperature		0	+50	°C	2.2
Storage Temperature		Тѕт	-20	+60	°C	2,3
Panel Front Temperature		Tsur	-	+68	°C	4
Operating Ambient Humidity		Нор	10	90	%RH	0.0
Storage Humidity		Нѕт	10	90	%RH	2,3

Note: 1. Ambient temperature condition (Ta =  $25 \pm 2$  °C)

- 2. Temperature and relative humidity range are shown in the figure below. Wet bulb temperature should be Max 39 °C and no condensation of water.
- 3. Gravity mura can be guaranteed below 40 °C condition.
- 4. The maximum operating temperature is based on the test condition that the surface temperature of display area is less than or equal to 68 °C with LCD module alone in a temperature controlled chamber. Thermal management should be considered in final product design to prevent the surface temperature of display area from being over 68 °C. The range of operating temperature may degrade in case of improper thermal management in final product design.

# **Product Specification**

## 3. Electrical Specifications

#### 3-1. Electrical Characteristics

It requires two power inputs. One is employed to power for the LCD circuit. The other Is used for the EEFL backlight and inverter circuit.

Table 2. ELECTRICAL CHARACTERISTICS

Table 2. ELECTRICAL CHARAC	TERISTICS					
Parameter	Symbol	Value			Unit	Note
raiametei	Symbol	Min	Тур	Max	Offic	Note
Circuit :						
Power Input Voltage	VLCD	10.8	12.0	13.2	VDC	
Dowar Input Current	ILCD	-	730	950	mA	1
Power Input Current	ILCD	-	1000	1300	mA	2
Power Consumption	PLCD		8.76	11.4	Watt	1
Rush current	IRUSH	-	-	5.0	А	3

- Note 1. The specified current and power consumption are under the  $V_{LCD}$ =12.0V, Ta=25  $\pm$  2°C,  $f_{V}$ =120Hz condition whereas mosaic pattern(8 x 6) is displayed and  $f_{V}$  is the frame frequency.
  - 2. The current is specified at the maximum current pattern.
  - 3. The duration of rush current is about 2ms and rising time of power input is 0.5ms (min.).

Lamp Frequency	f LAMP	43	45	47	KHz	
Established Starting Voltage @ 0 ℃	Vs			1175	V <sub>RMS</sub>	1, 3
Life Time		50,000	60,000		Hrs	7

Note The design of the inverter must have specifications for the lamp in LCD Assembly.

The electrical characteristics of inverter are based on High-High Driving type.

The performance of the lamps in LCM, for example life time or brightness, is extremely influenced by the characteristics of the DC-AC inverter. So, all the parameters of an inverter should be carefully designed so as not to produce too much leakage current from high-voltage output of the inverter.

When you design or order the inverter, please make sure unwanted lighting caused by the mismatch of the lamp and the inverter (no lighting, flicker, etc) has never been occurred. When you confirm it, the LCD–Assembly should be operated in the same condition as installed in your instrument.

\* Do not attach a conductive tape to lamp connecting wire.

If you attach conductive tape to the lamp wire, not only luminance level can be lower than typical one but also inverter operate abnormally on account of leakage current which is generated between lamp wire and conductive tape.

- 1. Specified values are defined for a Backlight Assembly. (20 lamp, 8 mA/Lamp)
- 2. Operating voltage is measured at  $25 \pm 2^{\circ}$ C(after 2hr.aging). The variance range for operating voltage is  $\pm$  10%.

Ver1.1 7 /43

# **Product Specification**

Vs = (Vpk-pk) / [2\*root(2)]

- 3. The Striking Voltage (Open Lamp Voltage) [Vopen] should be applied to the lamps more than Striking time (S TIME) for start-up. Inverter Striking Voltage must be more than Established Starting Voltage of lamp. Otherwise, the lamps may not be turned on. The used lamp current is typical value. When the Striking Frequency is higher than the Operating Frequency, the parasitic capacitance can cause inverter shut down, therefore It is recommended to check it.
- 4. Lamp frequency may produce interference with horizontal synchronous frequency. As a result this may cause beat on the display. Therefore, lamp frequency shall be away as much as possible from the horizontal synchronous frequency and its harmonics range in order to prevent interference. There is no reliability problem of lamp, if the operation frequency is typ  $\pm$  5KHz. But it should be applied in less than ABSOLUTE MAXIMUM RATINGS max voltage
- 5. The brightness of the lamp after lighted for 5minutes is defined as 100%. T<sub>s</sub> is the time required for the brightness of the center of the lamp to be not less than 95% at typical current.

The screen of LCD module may be partially dark by the time the brightness of lamp is stable after turn on.

- 6. Maximum level of power consumption is measured at initial turn on. Typical level of power consumption is measured after 2hrs aging at  $25 \pm 2^{\circ}$ C.
- 7. The life time is determined as the time at which brightness of the lamp is 50% compared to that of initial value at the typical lamp current on condition of continuous operating at  $25 \pm 2$ °C, based on duty 100%.
- 8. The output of the inverter must have symmetrical (negative and positive) voltage and current waveform (Unsymmetrical ratio is less than 10%). Please do not use the inverter which has not only unsymmetrical voltage and current but also spike wave.

Requirements for a system inverter design, which is intended to achieve better display performance, power efficiency and more reliable lamp characteristics.

It can help increase the lamp lifetime and reduce leakage current.

- a. The asymmetry rate of the inverter waveform should be less than 10%.
- b. The distortion rate of the waveform should be within  $\sqrt{2 \pm 10\%}$ .
  - \* Inverter output waveform had better be more similar to ideal sine wave.

# Product Specification

The reference method of burst dimming duty ratio.It is recommended to use synchronous V-sync frequency to prevent waterfall

(Vsync x 1 =Burst Frequency)

Though PWM frequency is over 182Hz (max252Hz), function of backlight is not affected.

- \* We recommend not to be much different between PWM duty and lout duty .
- \* Dimming current output rising and falling time may produce humming and inverter trans' sound noise.
- Burst dimming duty should be 100% for more than 1second after turn on.
- Equipment

Oscilloscope :TDS3054B(Tektronix) Current Probe : P6022 AC (Tektronix) High Voltage Probe: P5100(Tektronix)

- 10. The Cable between the backlight connector and its inverter power supply should be connected directly with a minimized length. The longer cable between the backlight and the inverter may cause the lower luminance of lamp and may require more higher starting voltage (Vs).
- 11. The operating current must be measured as near as backlight assembly input.
- 12. The operating current unbalance between left and right must be under 10% of Typical current | Left(Master) current Right(Slave) Current | < 10% of typical current

Ver1.1 9 /43

### Product Specification

#### 3-2. Interface Connections

This LCD module employs two kinds of interface connection, 51-pin connector and 41-pin connector are used for the module electronics and 14-pin connector is used for the integral backlight system.

#### 3-2-1. LCD Module

- LCD Connector(CN1): FI-RE51S-HF(manufactured by JAE) or IS050-C51B-C39(manufactured by UJU)

  Refer to below and next Page table
- Mating Connector : FI-R51HL(JAE) or compatible

Table 4-1. MODULE CONNECTOR(CN1) PIN CONFIGURATION

No	Symbol	Description	No	Symbol	Description
1	NC or GND	No Connection or Ground	27	Bit Select	'H' or NC= 10bit(D), 'L' = 8bit

25	R1EP	FIRST LVDS Receiver Signal (E+)	51	VLCD	Power Supply +12.0V
26	NC or GND	No Connection or Ground	-	-	-

Note

- 1. All GND(ground) pins should be connected together to the LCD module's metal frame.
- 2. All VLCD (power input) pins should be connected together.
- 3. All Input levels of LVDS signals are based on the EIA 644 Standard.
- 4. Specific pins(pin No. #2~#6) are used for internal data process of the LCD module. These pins should be no connection.
- 5. Specific pins(pin No. # 8~#10) are used for OPC function of the LCD module.

  If not used, these pins are no connection. (Please see the **Appendix III-4** for more information.)
- 6. LVDS pin (pin No. **#24,25,40,41**) are used for 10Bit(D) of the LCD module. If used for 8Bit(R), these pins are no connection.
- 7. Specific pin No. #44 is used for "No signal detection" of system signal interface. It should be GND for NSB(No Signal Black) during the system interface signal is not. If this pin is "H", LCD Module displays AGP(Auto Generation Pattern).

Ver1.1 10 /43

# 3-6. Power Sequence

#### 3-6-1. LCD Driving circuit

Table 8. POWER SEQUENCE

Davamatav		Value		Unit	Notes
Parameter	Min	Тур	Max	Unit	Notes
T1	0.5	-	20	ms	1
T2	0	<del>-</del>	-	ms	2
Т3	200	<del>-</del>	-	ms	3
T4	200	-	-	ms	3
T5	1.0	-	-	S	4
T6	-	-	T2	ms	5
<b>T</b> 7	0.5	-	-	s	6
T8	100	-	-	ms	7

Note:

- 1. Even though T1 is over the specified value, there is no problem if I2T spec of fuse is satisfied.
- 2. If T2 is satisfied with specification after removing LVDS Cable, there is no problem.
- 3. The T3 / T4 is recommended value, the case when failed to meet a minimum specification, abnormal display would be shown. There is no reliability problem.
- 4. T5 should be measured after the Module has been fully discharged between power off and on period.
- 5. If the on time of signals (Interface signal and user control signals) precedes the on time of Power ( $V_{LCD}$ ), it will be happened abnormal display. When T6 is NC status, T6 doesn't need to be measured.
- 6. If there is no abnormal display, no problem.
- 7. It is recommendation specification that T8 has to be 100ms as a minimum value.
- Please avoid floating state of interface signal at invalid period.
- \* When the power supply for LCD (VLCD) is off, be sure to pull down the valid and invalid data to 0V.

Ver1.1 18 /43

### **Product Specification**

# 4. Optical Specification

Optical characteristics are determined after the unit has been 'ON' and stable in a dark environment at  $25\pm2^{\circ}$ C. The values are specified at an approximate distance 50cm from the LCD surface at a viewing angle of  $\Phi$  and  $\theta$  equal to 0 °.

It is presented additional information concerning the measurement equipment and method in FIG. 9.

FIG. 9 Optical Characteristic Measurement Equipment and Method

 $\label{eq:ta} \textit{Ta= } 25\pm2\text{°C, VDD,H\_VDD,VGH,VGL=typ,}$

Gray Scale			-	-	-		6

Ver1.1 19 /43

### **Product Specification**

Note : 1. Contrast Ratio(CR) is defined mathematically as :

CR(Contrast Ratio) = Maximum CRn (n=1, 2, 3, 4, 5)

CRn = Surface Luminance at position n with all white pixels

Surface Luminance at position n with all black pixels

n =the Position number(1, 2, 3, 4, 5). For more information,

- 2. Surface luminance is determined after the unit has been 'ON' and 1Hour after lighting the backlight in a dark environment at 25±2°C. Surface luminance is the luminance value at center 1-point across the LCD surface 50cm from the surface with all pixels displaying white. For more information see the FIG. 10.
- 3. The variation in surface luminance ,  $\delta$  WHITE is defined as :  $\delta$  WHITE(5P) = Maximum( $L_{on1}, L_{on2}, L_{on3}, L_{on4}, L_{on5}$ ) / Minimum( $L_{on1}, L_{on2}, L_{on3}, L_{on4}, L_{on5}$ ) Where  $L_{on1}$  to  $L_{on5}$  are the luminance with all pixels displaying white at 5 locations . For more information, see the FIG. 10.
- 4. Response time is the time required for the display to transit from G(255) to G(0) (Rise Time,  $Tr_R$ ) and from G(0) to G(255) (Decay Time,  $Tr_D$ ).
- 5. Viewing angle is the angle at which the contrast ratio is greater than 10. The angles are determined for the horizontal or x axis and the vertical or y axis with respect to the z axis which is normal to the LCD module surface. For more information, see the FIG. 12.
- Gray scale specificationGamma Value is approximately 2.2. For more information, see the Table 9.

Table 9. GRAY SCALE SPECIFICATION

#### 9. Precautions

Please pay attention to the followings when you use this TFT LCD module.

# 9-1. Mounting Precautions

- (1) You must mount a module using specified mounting holes (Details refer to the drawings).
- (2) You should consider the mounting structure so that uneven force (ex. Twisted stress) is not applied to the module. And the case on which a module is mounted should have sufficient strength so that external force is not transmitted directly to the module.
- (3) Please attach the surface transparent protective plate to the surface in order to protect the polarizer. Transparent protective plate should have sufficient strength in order to the resist external force.
- (4) You should adopt radiation structure to satisfy the temperature specification.
- (5) Acetic acid type and chlorine type materials for the cover case are not desirable because the former generates corrosive gas of attacking the polarizer at high temperature and the latter causes circuit break by electro-chemical reaction.
- (6) Do not touch, push or rub the exposed polarizers with glass, tweezers or anything harder than HB pencil lead. And please do not rub with dust clothes with chemical treatment. Do not touch the surface of polarizer for bare hand or greasy cloth.(Some cosmetics are detrimental to the polarizer.)
- (7) When the surface becomes dusty, please wipe gently with absorbent cotton or other soft materials like chamois soaks with petroleum benzine. Normal-hexane is recommended for cleaning the adhesives used to attach front / rear polarizers. Do not use acetone, toluene and alcohol because they cause chemical damage to the polarizer.
- (8) Wipe off saliva or water drops as soon as possible. Their long time contact with polarizer causes deformations and color fading.
- (9) Do not open the case because inside circuits do not have sufficient strength.

#### 9-2. Operating Precautions

- (1) The spike noise causes the mis-operation of circuits. It should be lower than following voltage : V=±200mV(Over and under shoot voltage)
- (2) Response time depends on the temperature.(In lower temperature, it becomes longer.)
- (3) Brightness depends on the temperature. (In lower temperature, it becomes lower.) And in lower temperature, response time(required time that brightness is stable after turned on) becomes longer
- (4) Be careful for condensation at sudden temperature change. Condensation makes damage to polarizer or electrical contacted parts. And after fading condensation, smear or spot will occur.
- (5) When fixed patterns are displayed for a long time, remnant image is likely to occur.
- (6) Module has high frequency circuits. Sufficient suppression to the electromagnetic interference shall be done by system manufacturers. Grounding and shielding methods may be important to minimized the interference.
- (7) Please do not give any mechanical and/or acoustical impact to LCM. Otherwise, LCM can't be operated its full characteristics perfectly.
- (8) A screw which is fastened up the steels should be a machine screw. (if not, it can causes conductive particles and deal LCM a fatal blow)
- (9) Please do not set LCD on its edge.
- (10) It is recommended to avoid the signal cable and conductive material from the transformer, for it can cause problems such as the abnormal display, sound noise and temperature rising.
- (11) Partial darkness may happen during 3~5 minutes when LCM is operated initially in condition that luminance is under 40% at low temperature (under 5 °C). This phenomenon which disappears naturally after 3~5 minutes is not a problem about reliability but LCD characteristic.

Ver1.1 29 /43

#### **Product Specification**

(12) Partial darkness may happen under the long-term operation of any dimming without power on/off. This phenomenon which disappears naturally after 5 minutes is not a problem about reliability but LCD characteristics.

# 9-3. Electrostatic Discharge Control

Since a module is composed of electronic circuits, it is not strong to electrostatic discharge. Make certain that treatment persons are connected to ground through wrist band etc. And don't touch interface pin directly.

#### 9-4. Precautions for Strong Light Exposure

Strong light exposure causes degradation of polarizer and color filter.

#### 9-5. Storage

When storing modules as spares for a long time, the following precautions are necessary.

- (1) Store them in a dark place. Do not expose the module to sunlight or fluorescent light. Keep the temperature between 5°C and 35°C at normal humidity.
- (2) The polarizer surface should not come in contact with any other object.

  It is recommended that they be stored in the container in which they were shipped.

#### 9-6. Handling Precautions for Protection Film

- (1) The protection film is attached to the bezel with a small masking tape. When the protection film is peeled off, static electricity is generated between the film and polarizer. This should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition, etc.
- (2) When the module with protection film attached is stored for a long time, sometimes there remains a very small amount of glue still on the bezel after the protection film is peeled off.
- (3) You can remove the glue easily. When the glue remains on the bezel surface or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with normal-hexane.

### ■ Mega DCR Using Condition (1)

- After Inverter ON signal, Output current max duty should be sustained during 1sec.
- It is recommended not to sustain more than 10 min for Deep Dimming (Under min duty of the inverter output current : 0%~20%).

The deep dimming must be used very carefully due to limitation of lamp characteristics and specification.

1) For stable lamp on, its duty condition should follow below the condition. After Inverter ON signal, T0 duration should be sustained.

- 2) Under min duty (0%~20%) of the inverter output current, B/L may not satisfy some of LCM specification.
- Duration: Duration under min duty must be limited within 10 minutes.
- Ratio : The operation time under min duty must be less than 1/5 compare to that of the high duty operation(20%~Max duty) in a certain period to prevent unwanted operation.
- FOS: Partial darkness or darkness of center area during the low duty might be happened due to insufficient lamp current.
- Warm up: The operation under min duty must be used 3 min after the lamps "ON". In case of low temperature, more warm up time may be needed.

Ver1.1 39 /43

 $\blacksquare$  Gray to Gray Response Time Uniformity ( $\delta_{\, GTO\, G}$ )

This is only the reference data of G to G and uniformity for LC470WUD-SCA1 model.

1. G to G Response Time:

Response time is defined as Figure 3 and shall be measured by switching the input signal for "Gray (N)" and "Gray(M)".(32Gray Step at 8bit)

2. G to G Uniformity

The variation of G to G Uniformity ,  $\delta$  G to G is defined as :

G to G Uniformity = 
$$\frac{\textit{Maximum}(\textit{GtoG}) - \textit{Typical}(\textit{GtoG})}{\textit{Typical}(\textit{GtoG})} \leq 1$$

\*Maximum (GtoG) means maximum value of measured time (N, M = 0 (Black) ~ 255(White), 32 gray step).
